ENEE 350 Homework Set 7

Programming Project 2

(Due: Class 17, Thurs., Oct. 25, 2007)

Write, assemble and run successfully on the simulator a Mac-1 subroutine **lgneg(n,x)** that returns in the AC the address of the integer possessing the algebraically largest negative value along the real line among the n integers in the array whose starting address is x. The largest negative value on the real line is the farthest right value to the left of zero. If there are no negative values among the n elements to be processed, then return -1 which is equivalent to the address 65535, clearly not a valid memory address. If there are two or more array entries that equally satisfy the requirements, return the address of the one with the highest address. Your subroutine should be tested with the main program shown below, which defines how the parameters are passed.

	/main program		/continued from below halt
	EXTRN lgneg		data 57
ans1	RES 1		0
ans2	RES 1		129
ans3	RES 1		34
n1	6		8
n2	10		3
n3	5		-29
start	loco 4020		-15
	swap /initialize sp		-2
	loco n1		-347
	push /push address n1		-3
	loco data		6
	push /push array start address		35
one	call lgneg		-413
	stod ans1		END start
	insp 2		
	loco n2 /push address n2		
	push		
	loco data		
	add (4)		
	push /push array start address		
two	call lgneg		
	stod ans2		
	insp 2		
	loco n3 /push address n3		
	push		
	loco data		
	add (9)		
	push /push array start address		
three	call lgneg		
	stod ans3		
	insp 2		
	halt		
	/data array continues here but		
	/ is shown in the above right hand column		

Hand in a copy of the main program symbolic assembly listing, the subroutine symbolic assembly listing, the contents of (macro) memory after "load main sub" (i.e., of main.abs) before execution of the program, and the contents of memory after execution of the program. Highlight and comment upon the final answers. Specify what values are contained in the addresses specified by ans1, ans2, and ans3.
