Read Chapter 6, Section 6.1, of Tanenbaum's 5th Ed. textbook and work the following problems:

1. Prob. 6-2.
2. Prob. 6-4.
3. Prob. 6-5.
4. Prob. 6-9.
5. Prob. 6-13.
6. Prob. 6-15.
7. Prob. 6-16.
8. Prob. 6-17.
9. Consider a paging system that uses a one-level page table with a virtual memory size of $2^{24}$ bytes, a physical memory size of $2^{21}$ bytes, and a page size of $2^{10}$ bytes. The machine has byte addressing and the entire page table resides in the main memory at all times.
a. How many entries are there in the page table?
b. If a page table entry contains a "valid" bit, a "clean/dirty" bit, and the physical page frame number, how many bits are needed for each page table entry? (Note: the "valid" bit acts as a "presence" bit that indicates whether the mapping information in this page map table entry is valid. If " v " $=1$, the entry is valid and the page is present in physical memory; if " v " $=0$, the entry is not valid and any reference to the corresponding page will generate a page fault.)
c. With the assumptions in part b. above, how many pages does the page table require? (In this part assume that a page table entry requires an integral number of bytes; e.g., if your answer in part b. is 9 bits, then in part c. assume that a page table entry requires two bytes; hence, round up to the nearest integral number of bytes for each page table entry.)
d. At a given time in the operation of the machine, a portion of the page table is as given below. What is the physical address corresponding to the virtual address $4980_{10}$ ? (Hint: $2^{10}=1024$ )

| Virtual Page <br> Number | Valid <br> Bit | Physical Page <br> Number |
| :---: | :---: | :---: |
| 0 | 0 | 7 |
| 1 | 1 | 9 |
| 2 | 0 | 6 |
| 3 | 1 | 3 |
| 4 | 1 | 5 |
| 5 | 0 | 5 |
| 6 | 0 | 4 |
| 7 | 1 | 1 |
| $\ldots$ | $\ldots$ | $\ldots$ |
