Style Checklist

1. Have good indentation
2. If you’re using #DEFINE to define a constant, the variable name should be all uppercase
3. All other variable names should be meaningful and underscores should be used for multi-word variables
4. Avoid long lines of code (I shouldn’t have to scroll right to see all of your code)
5. Use parentheses for clarity (for example during long comparison statements)
6. Have comments before each of your functions and throughout your code to explain your thinking
7. Abstract your code and avoid duplicate code by creating functions for specific operations when necessary
